ema Electronics Ltd.

About ema

ema Electronics Ltd. is a professional manufacturer in the field of industrial switches and sensors, including automation and instrumental apparatus. Owing an outstanding R&D team which focus on the core technique and devoted to development and innovation, we provide our esteemed customers with All-in-One solutions as vertical integration including design, tooling, and production. We believe that the only way to offer the best industrial control system for customers is to be a total solution-provider. Through our enterprise concept, we can make our customers reduce the cost of operation, enhance the efficiency of work, and increase the quality plus the extra value of products. Moreover, ema has awarded to “iF Product Design Award 2008” and to be a member of AS-Interface association.

ema

ema showroom

All ema products meet CE certification and RoHS directive of EU.

EMA have owned three main series in the category of Fluid Sensors up to now: Temperature, Pressure, and Flow Sensors. These series with similar operating principles due to the similar structures, detecting, MCU processing, output and display units. By the signals sampled via probes, fluid sensors operate the

MCU (Multi Control Unit) to convert signals into digital ones which are displayed again as numerical values in a segmented display as 2-color LEDs. According to values set by the user they will be converted to digital or analog signals automatically. Users can control MCUs by using buttons on the housing. As long as the threshold value is reached, signals are generated. These outputs are the same with digital outputs (NPN / PNP outputs, hysteresis, NO / NC, window-function NO / NC); besides, pressure and temperature sensors generate analog signals (0-10V, 4-20mA). This series is completely protected from overload, short-circuit and reverse polarity. Protection rating is IP67.

EMA as a professional manufacturer in the field of sensors, Flow + Temperature Sensors has been awarded with 「iF product design award 2008」 which is one of top-three world famous industrial design competitions. It is also marked as a “design Oscar” because all judges are composed of international and outstanding designers. In 2008, a jury of specialists evaluated 2771 entries from 35 different nations. The best of our F+T sensors were selected for an award because we are able to convince international judges of the highest caliber, The judges are extremely critical in the discussion with the standard of criteria, such as design quality, workmanship, degree of innovativeness and environmental compatibility. This award proves that the product of ema can meet customer's need with its workmanship and its innovative design which said “art of technology.” That is why we can get a solid agreement from those professional judges.

EMA's electronic flow sensors operate in accordance with theory of thermo-diffusion that the sensors are using a physical principle, flowing mediums absorption and heat transportation. There are two thermistors and one heater in the probes. This heat cause an increase in temperature in certain areas, and the increased part is detected by one probe of them. As long as the mediums passes by, the probe can cool down which is again detected by the thermistors. Absorption rate are put into relation to a rate of flow which is indicated on the unit. Flow direction and position of sensor do not matter because the unit works without mechanical parts.

ema's temperature sensor detects the operating temperature by RTD probe and then transmits the data to an examining circuit. After processing, the current operating temperature is displayed through LED and converted automatically into a digital (NPN, PNP) or an analog (0-10V, 4-20mA) signal.

When the pressure acts on the interface of the ceramic-diaphragm, the diaphragm is deformed slightly. It is furthermore connected to a Wheatstone bridge through a thick-film-resistor in the back of the diaphragm. Due to the Piezo resistive Effect from voltage dependant resistors, the electric bridge will produce a high-linear voltage signal with a direct ratio to pressure. Then it is converted to a standard voltage signal which is then transmitted to the system. The 3-digit-segment display shows the value of pressure and then the value will be compared to setting points by the user. Finally, this value is converted to signals for switching output (NPN, PNP) or for analog output.

Features

FL series is an electronic device designed for monitoring a certain rate. Without mechanical components, this guarantees a reliable monitoring even in case of complex mediums over a long period. The purpose of FL series is to output a signal when the flow rate reaches the set-up range. Through control-calculation, FL series can proceed to warn or activate the chain of protection system in order to protect the key equipments and to avoid unexpected damage in production. It can not only successfully reduce the possibility of breakdown and the cost of maintenance, but also keep the countless reliability of operational safety and of economic benefits. FL series is provide stable and steady service and are useable in hazardous areas by adapting to the theory of thermo-diffusion. It can be inserted into the tube or the container and set up the flow rate to an expected value. FL series is an electronic flow sensor meant for modern industry. It is applied widely in highly developed countries and has surpassed traditional flow switches.

Mechanical Flow Switches

- Detect the flow mediums by the swing amplitude of themechanical paddles or probes.
- No matter of paddles or probes, the detection will be affected by the low sensitivity due to the rusty probes under a long-term working.
- Serious rustiness even causes the break of paddles or probes, and then falling probes may clog up the pipes or damage the machines. It not only makes the mechanical flow switches operate falsely ,but also face the derivational problems on the maintenance of pipe system and of machines.

Smart Flow Sensors

- Equipped with a mini probe, FL series does not effect the flow of mediums while detecting the flow rate.
- The unit is also useable for applications with a slow rate of flow which causes a slow fade in temperature at the probe. The other way round, fast rates of flow can also be detected very easily up to a maximum rate of flow.
- Using stainless steel for the probe means no rust and more accurate readings.

Flow + Temperature Sensor is the most progressive technique and is created exclusively to satisfy the demands of customers. It perfectly combines temperature sensor and flow sensor in one unit. The LED bar can display indication of the temperature and flow range aswell as output warning signals separately. With features such as high precision, usage of very small space, user-friendly handling and impressive design it can be applied in all industries. Those deal with electricity, sewage disposal, petroleum, chemical engineering, metallurgy, glass, coolant system, machinery production and more.

Types

EMA presents three current types in series of Flow Sensors: Smart Flow Sensors, Smart Flow + Temperature Sensors, and Compact Flow Sensors.

- Programmable smart flow sensor, user can set the flow range and the warning signal discretionarily
- Sensible substance: gas, liquids
- Display: LED
- Power protection: overload, short-circuit, reverse polarity

- Programmable smart flow + temperature sensor, and user can set the flow range and the warning signal discretionarily
- Visual indication makes control of this sensor easier
- Sensible substance: gas, liquids
- Display: LED
- Power protection: overload, short-circuit, reverse polarity
- Operating temperature: -25°C~80°C
- Sensing temperature: -25°C~80°C

- Stainless steel, concise structure, practical.
- High accuracy, high stability
- Sensible substance: gas, liquids
- Power protection: overload, short-circuit, reverse polarity
- Operating temperature: -25°C~80°C

- Programmable smart flow sensor, user can set flow range and warning signal discretionarily
- Sensible substance: gas, liquids
- Display: LED
- Power protection: overload, short-circuit, reverse polarity

Features

Temperature sensor is used very extensively in a variety of fields in industrial automation such as boiler system, cooling system, air-conditioner system, temperature control system of warehouse, and etc. ema's temperature sensor detects the operating temperature by RTD probe and then transmits the data to an examining circuit. After processing, the current operating temperature is displayed through LEDs. The signal is transferred automatically due to pre-set arrangements made by the user. Available are a digital (NPN / PNP) and an analog (0-10V, 4-20mA) signal.

Monitor temperature of cooling water of mould to increase or decrease the volume of flow of cooling water or to warn.

Detect pressure of enzymes or other chemicals in containers.

Detect temperature in liquid waste processing systems.

Detect temperature of oils in pipes of wind power equipments.

Types

EMA presents two current types in series of Temperature Sensors: Smart Temperature Sensors and Temperature Transmitters.

- Programmable smart temperature sensor, user can set the temperature range and warning signal discretionarily. offering 2 units of temperature, °C and °F, to be converted
- Visual indication makes the control of this sensor easier
- Sensible substance: gas, liquids
- Sensing temperature: -40°C~150°C
- Display: LED
- Power protection: overload, short-circuit, reverse polarity

- Concise structure and practical.
- High accuracy, high stability, and Resistant to interruption.
- Sensible substance: gas, liquids
- Power protection: overload, short-circuit, reverse polarity
- Sensing temperature: -40°C~+150°C
